Consider the functions $L_n(x)$ defined by

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}),$$

for non-negative integers n .

(a) Show that L_n is a polynomial of degree n and find the coefficients of x^{10} and x^9 of $L_{10}(x)$ in terms of factorials. [6]

(b) Let $v = x^n e^{-x}$. Verify that

$$x \frac{dv}{dx} = (n - x)v,$$

and differentiate this identity $n + 1$ times to show that L_n satisfies the differential equation

$$x \frac{d^2 L_n}{dx^2} + (1 - x) \frac{dL_n}{dx} + nL_n = 0.$$

[8]

(c) The previous equation can be rewritten as

$$e^x \frac{d}{dx} \left(x e^{-x} \frac{dL_n}{dx} \right) + nL_n = 0.$$

Hence, for any non-negative integers n, m ,

$$\begin{aligned} L_m e^x \frac{d}{dx} \left(x e^{-x} \frac{dL_n}{dx} \right) + nL_m L_n &= 0, \\ L_n e^x \frac{d}{dx} \left(x e^{-x} \frac{dL_m}{dx} \right) + mL_m L_n &= 0. \end{aligned}$$

Use these results to derive the orthogonality relation

$$\int_0^\infty e^{-x} L_m(x) L_n(x) dx = 0$$

for $m \neq n$.
